

A Online Appendix for

Reinvestigating the Reciprocal Relationship between Democracy and Income Inequality

This online appendix presents tables and figures with descriptive statistics, robustness checks and additional results. The first section presents figures with additional validation tests for the main inequality measure used in the paper (Wage Share), and descriptive statistics and correlation coefficients between the various inequality measures and between the different democracy measures used. The section also presents descriptive statistics for the control variables included in the baseline model of the paper, and also lists the observations entering that model.

The next section contains two tables with robustness tests – run on 5-year panels – of the “naive” baseline models with only exogenous regressors. The following two sections make up the main bulk of this appendix. These sections present models with endogenous regressors, and with democracy and inequality, respectively in the two sections, as dependent variables. Most of these models are GMM models run on 5-year panels, but also models on 1-year panels and 2SLS models are presented. Thereafter follows a section with various tests conducted on the imputed datasets, both for models considering democracy and inequality as dependent variables.

The final two sections provide results from the two most important extensions discussed in the paper: The next-to-final section presents results from so-called dynamic probit models that separate between effects (of inequality and of other independent variables) on democratization and on democratic survival. The last section presents tables with results from regressions separating between the effects of different *types* of dictatorships when investigating their effects on income inequality.

A.1 Descriptive statistics

Figure A.1: Bivariate correlation coefficients, by year, between share of income going to wage earners in manufacturing sector (WS) and share of total income going to top 5% income earners. The graph displays correlation coefficients from all countries with data (top) and OECD countries (bottom).

Figure A.2: Bivariate correlation coefficients, by year, between share of income going to wage earners in manufacturing sector (WS) and share of total income going to top 10% income earners. The graph displays correlation coefficients from all countries with data (top) and OECD countries (bottom).

Table A.1: Descriptive statistics for various democracy measures

Variable\Statistic	Mean	Standard deviation	Min	Max	Observations
Polity Index (normalized)	51.4	37.4	0	100	6806
Scalar Index of Polities	0.47	0.39	0	0.98	6599
Freedom House Index	3.91	2.04	1	7	5843
Unified Democracy Score (mean)	0.00	0.98	-2.10	2.12	7370
Democracy& Dictatorship measure	0.42	0.49	0	1	7431

Notes: The statistics are reported for all observations with data on a particular measure in the dataset.

Table A.2: Pairwise correlation coefficients between various democracy measures

	PI	SIP	FHI	UDS	DD
Polity Index (normalized)	1 (6806)				
Scalar Index of Polities	0.97 (6487)	1 (6599)			
Freedom House Index	-0.89 (5279)	-0.90 (5084)	1 (5843)		
Unified Democracy Score (mean)	0.94 (6734)	0.92 (6541)	-0.94 (5767)	1 (7370)	
Democracy& Dictatorship measure	0.84 (6793)	0.85 (6579)	-0.82 (5837)	0.85 (7357)	1 (7431)

Notes: Number of observations with data on both measures (and thus entering the calculations) provided in parenthesis.

Table A.3: Descriptive statistics for variables entering baseline model

Variable\Statistic	Mean	Standard deviation	5 th percentile	Median	95 th percentile
Wage Share	35.9	14.1	15.7	34.7	59.7
Polity Index	63.8	37.4	5	85	100
Ln GDP per capita	8.4	1.0	6.6	8.5	9.9
Ln GDP per capita squared.	72.1	17.0	43.7	71.7	98.4
Ln (oil and gas income p.c. + 1)	2.9	2.9	0.0	2.4	8.1
Ln (population in 1000s)	9.4	1.5	7.1	9.2	11.9
Ln (regime duration + 1)	2.7	1.2	0	2.8	4.5

Notes: The statistics are reported for the 3026 observations entering Model AI in Table 3.

Notes: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$. T-values in parentheses. Polity index is dependent variable, inequality is measured by Gini taken from WDI, and all independent variables are lagged by one (5-year) period. Standard errors are robust. For "endogenous regressors", "Set" designates all independent variables except period dummies. Regarding lags used for instrumentation, the numbers reflect the exact lag or lags used; e.g. "2" means that only the second lag was used, and "All" that there were no restrictions.

Notes: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$. T-values in parentheses. All independent variables are lagged by one (5-year) period. Standard errors are robust. For "endogenous regressors", "WS" designates wage share, and "Set" designates all independent variables except period dummies. Regarding lags used for instrumentation, the numbers reflect the exact lag or lags used; e.g. "2" means that only the second lag was used, and "All" that there were no restrictions.

Lag(s) used for Instrum.	All	All	2-5	All	3-5	3-5	All	All	3-5	3-5	All	All	All	All	2-5	2-5	All	2-5	2-5	All	All	3-5	3-5	3-5	3-5
Nr. Instruments	50	260	162	49	113	115	59	317	113	115	59	317	212	212	58	58	156	156	156	58	58	156	156	156	156

Notes: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$. T-values in parentheses. All independent variables are lagged by one (5-year) period. Standard errors are robust. For "endogenous regressors", "WS" designates wage share, and "Set" designates all independent variables except period dummies. Regarding lags used for instrumentation, the numbers reflect the exact lag or lags used; e.g. "2" means that only the second lag was used, and "All" that there were no restrictions.

A.4 Robustness tests of inequality models treating democracy as endogenous regressor

Table A.22: Fixed Effects 2SLS models using different measures of democracy and income inequality; second stage results.

Notes: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$. T-values in parentheses. SWIID disposable income inequality Gini is dependent variable, and all independent variables are lagged by one (5-year) period. Standard errors are robust. For “endogenous regressors”, “PI” designates Polity index, and “Set” designates all independent variables except period dummies. Regarding lags used for instrumentation, the numbers reflect the exact lag or lags used; e.g. “2” means that only the second lag was used, and “All” that there were no restrictions.

Notes: * $p < .10$; ** $p < .05$; *** $p < .01$. T-values are reported in parentheses. The (normalized, 0–100) polity index is dependent variable in Models I-III and wage share is dependent variable in Models IV-VI. Models I-II and VI-V are OLS PCSE models. Models II and VI are fixed effects models. Independent variables are lagged with one year in all models. Standard errors in PCSE models are based on panel-specific AR(1) autocorrelation and take into account panel heteroskedasticity. Standard errors in FE models are clustered by country. Fixed effects models include both country- and year dummies, but these are omitted from the table. The maximum length of time series is from 1961 to 2008. The models also include imputed data; the reported coefficients are averages over ten data sets and the errors are imputation corrected.

Table A.37: GMM Democracy models with PI as dependent. 1-year panels. Including imputed data.

Notes: * $p < .10$; ** $p < .05$; *** $p < .01$. T-values in parentheses. All models are dynamic probit, with errors clustered on country. Dichotomized PI (democracy if $PI \geq 6$) is dependent variable in Models I–III and ACLP is dependent variable in Models IV–VI. “Interaction terms” are independent variables multiplied with lagged regime. Year-dummies and year-dummies interacted with lagged regime are omitted from table. Gini coefficients (from SWIID) are reversed (0–100). Maximum time-series is 1961–2008. Independent variables are lagged with 1 year. The models also include imputed data; the reported coefficients are averages over ten data sets and the errors are imputation corrected.

A.7 Distinguishing between effects of different types of dictatorships

Table A.45: Autocratic regime types, income inequality and redistribution (notice that Gini coefficients here are reversed)

Notes: * $p < .10$; ** $p < .05$; *** $p < .01$. T-values in parentheses. Country-year is unit of analysis. Democracy, as operationalized by Hadenius and Teorell (2007), is reference category for regimes. All models are OLS PCSE models where errors are adjusted for panel-specific AR(1) autocorrelation and panel-level heteroskedasticity. Maximum time-series is 1972–2008. Independent variables are lagged with one year. Gini coefficients (from SWIID) are reversed (0–100)
